The publication of keys to the genera *Merodon* (Speight & Langlois 2020) and *Eumerus* (Speight et al. 2021) led to the reexamination of the Syrphidae material collected for this paper. A few specimens had their identification corrected.

The new species of *Pelecocera* has now been named *Pelecocera garrigae*, in a recent review of the genus (Lair et al. 2022).

The whole list of Syrphidae of the Calanques National Park now totals at least 35 taxa, in 26 genera:

- 33 named species
- 2 species of additional genera which to date could not be identified: *Platycheirus* sp (a damaged female specimen) and a *Pipizella* specimen, which needs direct comparison with reference material.
- 2 female specimens to otherwise already identified genera belong to additional species, but remain unidentified to species level: *Cheilosia* sp. (*cf latifrons*) and *Merodon* sp. (*cf. natans*).

A few female specimens of *Eumerus* and *Merodon* remain unidentified as for many species of these genera only males are reliably identifiable (Speight & Langlois 2020 ; Speight et al. 2021).

Additionally, a few damaged specimens remain unidentified to the species level (genera *Chrysotoxum*, *Meliscaeva*, *Paragus*).

The updated version (Ropas2020_suppl_mat_v02.xlsx) of the supplementary material is now online on Hal (<https://hal.archives-ouvertes.fr/hal-02869143>).
